

HAIRY WASTE

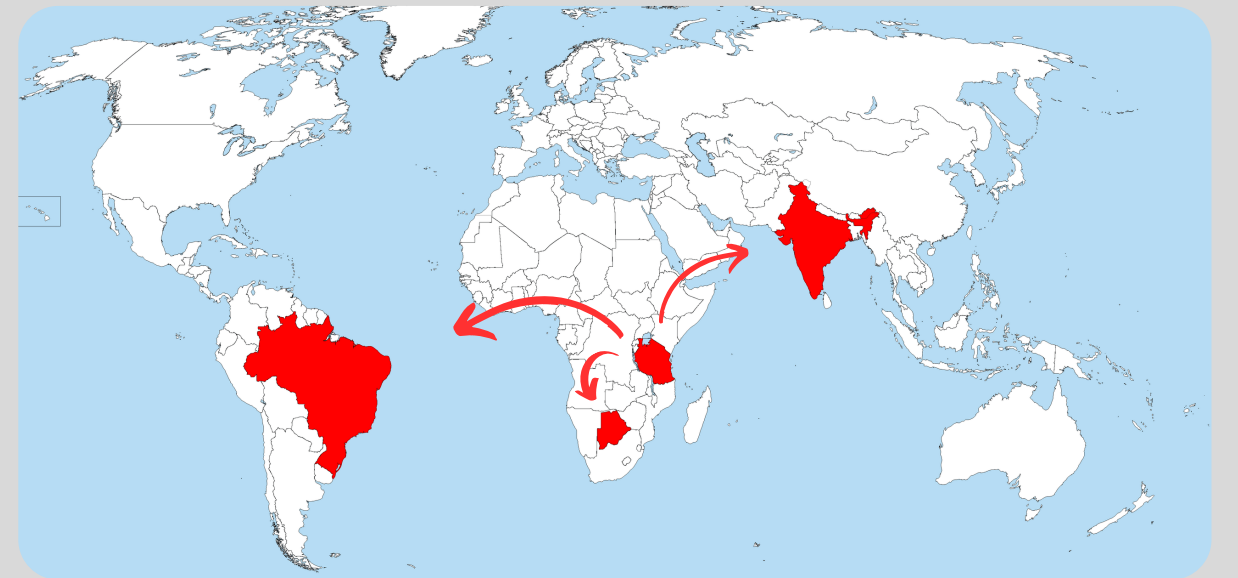

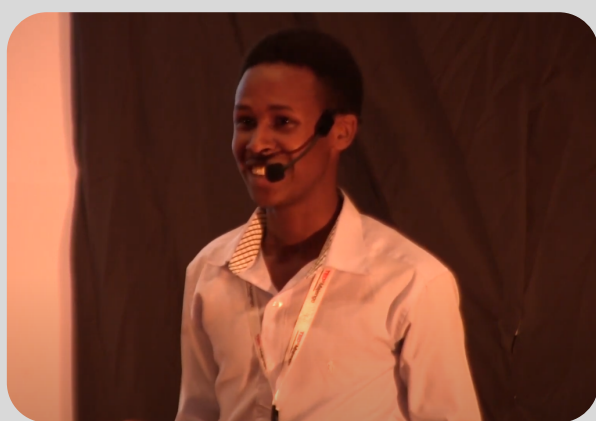

"Every day salons in North America produce about 63,000 pounds of hair, 42,000 pounds of chemicals, and 235,000 pounds of paper and plastics" (Marquis, 2022).

1 Hair can be reused to create fertilizer that supports productivity in the agricultural sector.

Producing Fertilizer from hair waste not only reduces a waste problem but also creates job opportunities to many in the agricultural field.

Apart from hair waste going into landfills, it can be reused in the production of fertilizer, absorbing mats, and new salon materials.

2 Human hair is really efficient in absorption. Hair is collected from hairdresser salons and recycled into absorption mats addressing the problem of hydrocarbon oil pollution.

3 Reusing hair clipping can create bio composite plastic.

Everyone should take time to analyze where their hair goes after having a good haircut.
